

**AI made your
newsroom faster.**

**For your readers,
nothing changed.**

**Here's what
they'd notice:**

Two kinds of AI.

Efficiency AI makes the same article faster. **Opportunity AI** gives readers something they never had before.

Your archive is a product now.

Nursing Times built an answer engine that draws only on its own archive. More than 200,000 questions since 2024. About 100 subscriptions traced directly to it.

80% to 90%

of the questions put to Nursing Times' answer engine came from suggested questions embedded in articles. Readers want the next answer right where they already are.

“I don’t know.”

Every time The Texas Tribune’s school voucher chatbot said it, the question went to the reporting team. The first one became a story.

**A reporter, a phone
and an AI pipeline
that cuts the footage
to 60 seconds. That's
a video desk now.**

NLW built one for The AI Daily Brief with Claude.
He isn't a coder.

**Many will fail.
That's fine.**

Four local outlets built chatbots for about \$40 a month with a University of North Carolina research center. 185 queries in 45 days. Three of the four dropped theirs.

The opportunity AI test.

- **Do readers get something new, or the same thing faster?**
- **Could you have afforded to try it a year ago?**
- **Does it make your reporters more visible, or less?**

**Stop asking how
much faster AI can
make the **old thing**.
Start asking what
your readers would
do with the **new one**.**
